

Hi Claude,

Familiarise yourself with the main website and other wireframes available.

Role:

You are a one-person digital agency — combining the roles of Business Analyst, UI/UX Lead, CMO, Content Strategist, Copywriter, Senior Full-Stack Engineer, QA Engineer, and DevOps Engineer. Your job is to take a user from a raw idea to a fully built, production-grade, greenfield website through a structured, phased workflow.

We are going to redefine the website based on the theme <https://website-hdn2.vercel.app/b>

In this theme, we are going to make certain changes:

1. Remove the numbering for all sections.
2. The hero section needs to be redesigned, showing something like Kheelu talking to Lumi. Sample image here.

What i am thinking is to have this image on the right side and few interactive bubbles around it with some minimal content.

3. Recognised by content seems to be missing, pick it from <https://website-hdn2.vercel.app/>
4. The website looks too text heavy. Let's create and use assets / info graphics / interactive elements / etc etc.
If you need to generate anything, give me prompt for that, along with assets to be used in that, i will use gemini manually and create them. Example you need lumi with some thing, give me lumi image + text, i will generate and share back.
5. The website seems to be out of brand colour, here is my brand colours, pick colour only from this.

- This section from the current website is good, can we please update it a bit in the language style of version B website and include it.

How Lumi compares.

A simple, honest look at what is out there.

	Lumi	Smart toys	Phone / TV	Static toys
Screen-free	Yes	Varies	No	Yes
Holds a conversation	Yes	Limited	No	No
Speaks your language	Yes (10)	Rarely	Varies	No
No open internet	Yes	Rarely	No	Yes
The parent sees everything	Yes	Partial	Partial	No
Made for ages 3 to 6	Yes	Varies	No	Varies

We can make the words around how a parent will like to read not technical.

- Use only these fonts

8. In the new website we need all the pages as per our current website. But make sure we are using a centralised theme and story around.
We **MUST MAKE** sure it looks like connected website and each page should not look like something new / disconnected.
9. Ask me for 3 mobile app images, i will share that and you use all three, as mobile app is very important for parents. Build the website with the images you have and ask me for this at the last after we deploy 1st version.
10. In case you need access to few elements you can pick them from this repo, it's our other website: <https://github.com/apoorva262/kheelona.ai>
11. Some other optional notes:
 - a. In section 3, we should use our branding shapes for each point

We do not sell data.

Your child's voice and words are never sold, and never used to sell them anything. That is a promise, not a setting you have to go find.

Lumi thinks on the device.

The first thinking happens on Lumi itself, before anything is sent anywhere.

You hold the keys.

Read every conversation. Delete anything in one tap. Choose the topics. The grown-up decides, always.

No open internet.

Lumi answers from a library you can see, not the open web. It wakes to a word, and the mic is off the rest of the time.

Be careful
or the fun.

Here is what a day with Lumi feels like.

- b. This section is missing content, for this section maybe we can show kheelu in between and surrounded by activities / stats rotating card - <https://pin.it/19tEfJj8h> (reference)
- c. Section 6 can look similar to this reference,

When we click on the lumi card, this type of tab should open

IMPORTANT NOTES:

1. Do not assume things, if you have any questions or if you have multiple options and need help in selecting, ask me. I am available for any consumer facing questions.
2. You need to follow the process / folder structure already set up.
3. Make sure you are keeping our design system always updated with a copy of all relevant assets and instruction on how to use them. Once the website is ready, all other team will use the design system as the only source of truth for all brand guidelines, including visual, assets, writing style, etc, so make sure it's always updated and sharable. Never hard-code values that belong in the design system.
4. Always keep your documentation updated, we have to compress / clear context at any point of time. For this complete revamping of the website, create a working file and always keep it updated in detail, so that we can restart anytime. Create a small but important note in [claude.md](#) to refer to this working file about the status. Once the implementation is complete and approved you can delete this working file. Never rely on conversation memory — always write to files.

5. I have installed many marketing skill on project level related to different topic, always use them along with default skills and your naked AI capabilities, it will give better performance.
6. Use Chrome in claude plugin to as required to visit and research websites as required.
7. You can use google analytics via Chrome in claude, i have logged to a personal account. Use this only to research and do not edit anything in google analytics.
8. Conduct real market research to gather data. Do not rely solely on what the user provides — actively research their industry, competitors, and search landscape. Use relevant skills and and online research.
9. Write production-ready copy for the entire website, guided by the content strategy and research.
10. Plan the quality assurance and launch readiness strategy before building. These plans get included in the blueprint and executed during/after implementation.
11. Never access files or directories outside the master project folder.
